

MEASUREMENT

Continuous measurement - record every instance of behavior

- 1) Frequency - count
- 2) Duration - how long the behavior lasts
- 3) Latency - time between SD being given and the beginning of the response
- 4) IRT - time between two instances of the same behavior
- 5) Rate - frequency of a behavior occurring per unit of time

Discontinuous measurement - record samples of a behavior in intervals

- 1) Whole-interval recording - if the behavior occurs for the entire interval
- 2) Partial-interval recording - if the behavior occurs AT ALL in the interval
- 3) Momentary time sampling - if the behavior is occurring at the end of the interval

Permanent Product - observation of end result of behavior

Data & Graphs - used to summarize, analyze, and communicate data to make decisions (visual analysis)

- 1) Line graph - used to show changes in a behavior over time
- 2) Bar graph - allows us to compare against categories

ASSESSMENT

Preference assessments

- 1) Indirect preference assessments
 - Surveys, interviews
- 2) Direct preference assessments
 - Free operant - many stimuli presented at once within a space for free access, time how long learner spends with each item
 - Single stimulus - one item presented at a time in random order, measure approach, whether they engage, and duration of engagement

-
- Paired/forced choice - two items presented at a time, learner picks one and engages for a set amount of time. All items must be present with one another
 - Multiple stimulus with replacement (MSW) - 3+ items presented at once, learner picks one and engages for a set time, chosen item is put back with selections, continues until all items are presented together
 - Multiple stimulus without replacement (MSWO) - all items presented at once, learner chooses item and engages for a set time, item is then removed. Continues until all items have been selected. Usually done multiple times to ensure accuracy

ABC data - antecedent -> behavior -> consequence

SKILL ACQUISITION & BEHAVIOR REDUCTION

Discrete-trial teaching - structured, systematic method. Skills are broken down into specific parts and taught with a clear SD, RESPONSE, AND CONSEQUENCE

- Error correction - taking the learner from incorrect responses to correct/independent responses

Naturalistic teaching - less structured method.

- Using learner's natural motivation
 - Embedding learning tasks into the natural environment and routines
 - Using natural reinforcers for the task
 - Using common stimuli in the natural environment
- 1) Capture learning opportunities - capitalizing on opportunities as they naturally occur
 - 2) Contrive learning opportunities - setting up the environment in a specific way to create an opportunity

Chaining - breaking up larger behaviors into smaller, more manageable tasks

- Open - steps currently being taught or that the learner can perform
 - Closed - steps that are immediately prompted (errorless)
- 1) Total task chaining - ALL steps are open from the beginning
 - 2) Forward task chaining - steps are opened from the beginning of the chain
 - 3) Backward task chaining - steps are opened from the end of the chain until all steps are opened

Shaping - gradually reinforcing new forms of a behavior from its current form (entry behavior) to your eventual goal (terminal behavior)

- Successive approximation - a response or behavior that is progressively closer to the targeted terminal behavior

Discrimination Training - systematically teaching a learner what stimuli receive reinforcement and which do not for a specific response.

- SD - reinforcement is available
- Stimulus Delta - reinforcement is not available
- Stimulus control - a stimulus is presented and evokes a specific behavior

Stimulus control transfer - **fading prompts**. Transferring control from one SD to our chosen SD or natural cue.

Ex. "Write your name." 1. Trace full name 2. Trace half, write half independently
3. Write full name independently without tracing

Ex. "Say dog." 1. They repeat "dog" after you say it. 2. Show a picture of a dog as you prompt "say dog." 3. They say dog when they see a photo of a dog

Prompting - supplemental cue in addition to the natural cue, to engage in a specific behavior

- 1) **Physical prompts** - full, partial (above elbow), graduated guidance (shadowing)
- 2) **Verbal prompts** - direct or indirect vocal instructions, signs, & visuals

- 3) **Model prompts** - demonstrating all or part of a task (video, in person)
- 4) **Movement prompts** - gestures, pointing, hand motions, eye gaze to cue
- 5) **Redundancy prompts** - emphasizing shape, size, color of stimulus
- 6) **Positional prompts** - placing stimulus in more prominent position

- Least-to-most - less to more intrusive prompts as needed
- Most-to-least - most intrusive prompt gradually move to less intrusive prompt
- Stimulus fading - gradually reduce the presence of the supplemental stimulus/prompt until just the natural cue remains
- Errorless teaching - providing prompts before behavior to prevent errors

Token economies - delivery of generalized conditioned reinforcement in the form of tokens (points, stickers, stars) that can be exchanged for actual tangible reinforcement or activities

Crisis/Emergency -

- 1) Prevention - behavior intervention plan, environment set up
- 2) De-escalation - removing triggering stimulus, communication
- 3) Crisis intervention protocol for safety, then calming down

Antecedent Interventions - take place before the behavior to prevent undesirable behaviors and make desired behaviors more likely

- Motivating operation - environmental variable with 2 effects:
 - Value altering - makes reinforcers more or less valuable
 - Behavior altering - make behaviors more or less likely
- Response effort - how hard or easy it is to engage in a behavior
 - Ex. effort is higher when you want to access your phone with a passcode vs without one

- 1) Activity schedules: use words and/or pictures to show steps needed to complete an activity
- 2) Priming: a reminder/statement preparing learner for something that is about to occur
- 3) Visual timers: timers with visual or auditory components to signal how much time is left
- 4) Noncontingent reinforcement (NCR) - providing something (like attention or a tangible) based on time/ a schedule to decrease motivation to engage in certain behaviors
- 5) High-probability instructional sequence - present 2-5 easy directions followed by a harder task (behavioral momentum)
- 6) Opportunities to respond (OTR) - providing frequent opportunities to respond during instruction w quick pacing
- 7) Task interspersal - mixing easier and harder tasks together to keep momentum going, but not in a specific sequence
- 8) Chunking - break tasks into smaller parts
- 9) Choices
- 10) Environmental arrangement - setting up environment for success (putting dangerous items away, free of clutter/distractions, keep materials readily available/accessible)

Differential Reinforcement - providing reinforcement more for one behavior and less/none for another in order to increase/decrease behaviors

- 1) Functional Communication Training - DRA procedure where the alternate behavior is some type of communication
 - 2) Differential reinforcement of alternative behavior (DRA) - reinforce behavior that serves same function as reduced behavior
 - 3) Differential reinforcement of other behavior (DRO) - reinforce for ZERO rates of behavior over specific interval
 - 4) Differential reinforcement of incompatible behavior (DRI) - reinforce behavior that cannot physically happen at the same time as the interfering behavior
-

- 5) Differential reinforcements of high rates (DRH) - reinforce when behavior occurs above a certain rate
- 6) Differential reinforcement of low rates (DRL) - reinforce when behavior occurs below a certain rate

Extinction - when a behavior is no longer being reinforced as it once was causing a decrease in the rate of behavior (goal to zero)

- Extinction burst - temporary increase in the rate of behavior following implementation of extinction
- Spontaneous recovery - when the behavior occurs again after previously decreasing to zero
- Extinction induced variability - learner tries new responses/behaviors to get their need met, OR emotional outbursts and aggression

PROFESSIONALISM & REQUIREMENTS

Session notes

- Objective and observable

Client Dignity

- Clients make choices
- Participate in forming their treatment plan
- Age-appropriate language
- Respectful, positive attitude
- Confidentiality
- Ensuring privacy
- Upholding basic rights and needs (food, water)

Professional boundaries

- Do not accept gifts exceeding \$10
- Avoid multiple relationships (friendship, romantic, sexual, etc)
- Avoiding engaging in convos that are irrelevant to client's therapy
- Confidentiality of client's treatments, only with authorized personnel

- Personal space
- Ethics code

Supervision requirements

- **5%** of your hours supervised by BCBA /month
- At least **2 face to face live** supervision meetings /month
- At least **1 observation** of you providing services /month

Clinical direction - seek when:

- New and complex client goals
- Unsure about procedure/intervention
- Challenging behaviors
- Ethical dilemmas
- Client progress issues
- Parent is requesting advice outside of RBT's scope of practice
